About
BIRR

BIRR and IVF Labware: it's embryologic! Why?

BIRR has fertility expertise since 1971

All BIRR's IVF Labware has been designed in close collaboration with embryologists

BIRR's IVF labware portfolio is developed and produced in the EU, according to the highest quality standards

All BIRR's IVF Labware is CE Class IIa MDD certified

BIRR offers a complete IVF labware portfolio

BIRR commits to a reliable delivery process

If there's a customer/patient need for new products, BIRR designs it

About
BIRR

BIRR IVF Labware quality testing and certification standards

BIRR IVF Labware is developed and produced according to the highest quality standards. All our qualitative tests are performed in a state-of-the-art laboratory, which strives for continuous improvement on testing reliability and accuracy. This enables BIRR to ensure that labware products are safe and performant.

| BIRR IVF labware certification and testing standards | Dishes | Tubes | Containers | Pipettes | Other labware |

| MEA (+) test | ✓+ | ✓ | ✓ | ✓ | ✓ |
| LAL test | ✓ | ✓ | ✓ | ✓ | ✓ |
| SMA test | ✓ | ✓ | ✓ | ✓ | |
| Produced in EU | ✓ | ✓ | ✓ | ✓ | ✓ |

BIRR IVF labware is registered in several countries in Europe, North-America, South-America and Asia. When required, local regulatory registration will be established. For information about specific geographies, please reach out to us.

BIRR introduces its smART Labware label:
BIRR IVF labware with innovative feature and added value on ease of use or safety versus conventional labware

BIRR IVF Labware certification standards

BIRR IVF Labware is also certified according to the highest standards.

All BIRR IVF labware products are Medical Devices: they are certified CE Class IIa sterile Medical Devices in accordance with 93/42 EEC Directive. Medical devices (MD) are intended and tested for direct or indirect use with a human body (e.g., in vivo and in vitro).

CE IIa marking indicates that the product meets the high safety, health and environmental requirements set by the European Union. In Europe and other geographies, CE IIa marking is compulsory for products used in IVF treatments.

Different from Medical Devices, in Vitro Diagnostics Devices (IVD) are intended and approved for use in testing of human samples, where the results can assist in clinical diagnosis. Thus IVD-products are for diagnostic purposes only, NOT for clinical use.

BIRR IVF Labware testing standards

Why does BIRR have a robust testing program of its IVF labware portfolio?

MEA, LAL and SMA tests are performed to detect whether the materials and processes employed in labware manufacturing affect gametes viability or embryo development. Successful testing ensures undeviating labware performance that doesn't interfere with specimens' biological processes. Lack of product quality assurance through each of these tests may compromise labware consistency, ultimately affecting laboratory and clinical outcomes. BIRR's robust quality assurance program ensures that labware standards are persistently maintained, providing laboratories the stability required for reliable gamete and embryo culture performance.

Test carried out on each product LOT:

Mouse Embryo Assay (MEA): Across the labware portfolio, two different type of MEA tests are performed, the Standard MEA or Extended MEA

- **The Standard MEA** is performed on the labware that has contact time <24 hours with gametes or embryos (e.g., tubes, pipettes). This approach involves the exposure of culture media to the tested labware for 2 hours. This media is then used for incubation of 1-cell mouse embryos (n=21, Test group) until Day 5 of development in a reference dish. In parallel, 1-cell mouse embryos (n=15, Control group) are cultured in the same type of reference culture dish using media that was not exposed to the testing labware. For each group, embryo cleavage is assessed at 24hrs and blastocyst formation is assessed at 96hrs (Day 5 development). A product lot is accepted when testing outcomes show blastocyst formation rate >80% in the Test group.
- **The Extended MEA (MEA+)** is performed on labware that has a contact time >24 hours, done for all dishes. This approach involves continued exposure of 1-cell mouse embryos (n=21, Test group) to the tested labware throughout a 96hrs culture period (Day 5 of development). In parallel, 1-cell mouse embryos (n=15, Control group) are cultured in the same type of reference culture dish using media that was not exposed to the testing labware. For each group, embryo cleavage is assessed at 24hrs and blastocyst formation is assessed at 96hrs (Day 5 development). A product lot is accepted when testing outcomes show blastocyst formation rate >80% in the Test group.

Sperm Motility Assay (SMA) test: Good quality post-preparation sperm samples are exposed to the testing labware (Experimental group) or left in the reference labware (Control group) for 8 hours. The ratio between sperm motility rate from the Experimental and Control groups determines sperm motility index (SMI). Product lot acceptance threshold is set at SMI >0.75.

Limulus Amebocyte Lysate (LAL) test: Presence of bacterial endotoxin lipopolysaccharide (LPS) is tested through LAL test on all labware. Acceptance detection threshold <0.03EU/device.

Results of quality test are available upon request for each LOT number.

IVF Dishes

Why our IVF Dishes

Quality

- Class IIa sterile Medical Device in accordance with the 93/42 EEC Directive
- Manufactured by BIRR in EU
- Specifically designed for IVF
- Non-pyrogenic
- MEA+ tested
- Sterility assurance level 10^{-6} (by irradiation)
- IVF dishes are made of medical-grade Polystyrene (PS)

Benefits

- Raised bottoms (200 micron air layer) to avoid scratches, minimize overheating in case of temperature spikes in the heated stage and provide uniform adherence to the surface
- Scratch protection improves visibility and safety
- Temperature consistency across all dishware suite

Article code & Packaging

1130056 packed by 6 / 180 per box

Testing

MEA+, LAL & SMA per LOT number

smART characteristics

- Sloped walls of the wells facilitate specimens identification and recall
- Wide well design improves accessibility to the specimen and its manipulation
- Large labelling area accommodating all types of handwriting, ID labels, barcodes and RFID tags
- Clear well identification provided by well numbering 1-5
- Round edges

Intended use

- Multipurpose dish
- Cell culture (gametes or embryos)
- Oocyte insemination (IVF) and denudation

smART characteristics

- Clear embryo/position identification due to well-numbering 1-8 (8 x 100 μ L wells), 9-12 (4 x 150 μ L wells)
- Compatible with either individual or group embryo culture
 - Small wells to store embryos after washes in the bigger wells (individual culture)
 - Big wells to store multiple embryos after serial washes in the smaller wells (group culture)
- No droplet mixing

Intended use

- Cell culture (gametes or embryos)
- Oocyte insemination (IVF) and denudation
- Handling or manipulation of embryos or gametes

Upgraded
& smART

Article code & Packaging

1130-CW single packed / 100 units per box

(upgrade in later stage info will follow)

1131-CW packed by 10 / 240 units per box

(UPGRADED version)

Testing

MEA+, LAL & SMA per LOT number

smART characteristics

- The dish now features room for labelling on the side wall (this was not possible due to the 360°grid of the previous version)
- The new design improves handling of both the dish and its lid, making the product more user friendly

Intended use

- Embryo transfer
- Cell culture (gametes or embryos)
- Oocyte insemination (IVF) and denudation

Characteristics

- Low walled dish allows better access of micromanipulation pipettes to specimens
- The lid features a tight fit to the dish preventing gas exchange
- Rugged 360° rim confers increased hand grip during operations

Intended use

- Intracytoplasmic Sperm Injection (ICSI)

Nominal and Working Volume of BIRR's dishes portfolio

| BIRR Dishes portfolio | Item | Nominal Volume | Working volume (working range) |
|-------------------------------|------------|----------------|--------------------------------|
| 5-Well Dish Round Edges | Well | 1.87 mL | 1.3 mL (1.0 mL - 1.4 mL) |
| Square ICSI Dish | Dish | 18 mL | 7 mL (6 mL - 8 mL) |
| Square Center-Well Dish | Inner | 2.2 mL | 1.5 mL (1.0 mL - 2.0 mL) |
| | Outer | | 4.0 mL (3.5 mL - 4.5 mL) |
| 6-Well Dish | Well | 480 µL | 300 µL (200 µL - 400 µL) |
| 16-Well Dish | Drop | 9 µL | 25 µL (20 µL - 25 µL) |
| | Dish | 22.8 mL | 7 mL (5 mL - 9 mL) |
| 4+8-Well Dish | Large Drop | 91 µL | 150 µL (130 µL - 170 µL) |
| | Small Drop | 62 µL | 100 µL (90 µL - 120 µL) |
| | Dish | 21.2 mL | 8 mL (7 mL - 10 mL) |
| Culture Dish 35 mm Time Lapse | Drop | | 20 µL |
| | Dish | 8.8 mL | |
| Culture Dish 35 mm | Dish | 9.3 mL | 5 mL (4 mL - 6 mL) |
| Culture Dish 60 mm | Dish | 28 mL | 7 mL - 14 mL |
| Culture Dish 90 mm | Dish | | |
| Center-Well Dish 60 mm | Inner | 2.2 mL | 1.5 mL (1.0 mL - 2.0 mL) |
| | Outer | | 2.5 mL (2.0 mL - 3.5 mL) |
| ICSI Dish 60 mm | Dish | 16.2 mL | 8 mL (6 mL - 10 mL) |

Disclaimer: these values are indicative and depending on use (e.g., embryo transfer, oocyte culture), each laboratory must validate solutions volumes prior to clinical use.

Nominal volume: the total capacity of the well, microwell or dish calculated as length x width x height of its walls.

Working volume: the amount of liquid required to operate the well, microwell or dish in a way that maximises performance and minimizes nuisance (e.g., spillage).
